

## Exercise

- Let  $p_1 = 0.2$   
 $p_2 = 0.4$   
 $p_3 = 0.1$   
 $p_4 = 0.3$

$$\bullet \text{ CRR} = \frac{P(Y^{a=1}=1)}{P(Y^{a=0}=1)} = \frac{P(D^{e=1}=1)}{P(D^{e=0}=1)} = \dots \textcircled{*}$$

↑  
Jewell's notation

④ Numerator: Proportion of people in the population that fall ill under the exposure:

$$\frac{N \cdot p_1 + N \cdot p_2}{N} = p_1 + p_2$$

Denominator: Proportion of people in the population that fall ill without exposure

$$\frac{N \cdot p_1 + N \cdot p_3}{N} = p_1 + p_3$$

$$\leadsto \text{CRR} = \frac{p_1 + p_2}{p_1 + p_3} = \frac{0.6}{0.3} = 2$$
